

STANDARD OPERATING PROCEDURE

Import Non-Sellable Ingredients into Toast IQ Inventory

Field	Detail
Owner	Anum Qassam
Source	Loom walkthrough: "Import Non-Sellable Ingredients into Toast IQ" (11 min)
Applies to	Inventory onboarding of a customer location in Toast IQ / Toast Retail
Tools	Cowork (Toast Inventory Ingredient Import skill), IQ Inventory Onboarding Agent (desktop app), Toast Web
Est. time	30–45 minutes per location (plus up to 10 min for the price spot-check)

1. Purpose

Turn a customer's invoices and ingredient data into non-sellable ingredient items in their Toast inventory location, with correct per-unit costs, primary units, suppliers and categories.

2. Before you start

- **Customer files:** invoices, order guides, price sheets or ingredient exports (CSV, Excel or PDF).
- **Intro-call notes:** create and review categories together with customer if possible, discovering any custom categories preferred
- **Customer location GUID.**
- **Access:** Toast Web login, Okta login and Okta Verify set up on your device.
- **A running customer folder** to save every file Cowork and the tool generate. These feed the final customer report.

3. Procedure

Step A — Generate the import file in Cowork

1. In Cowork, go to **Customize** and find the shared skill **Toast-Inventory-Ingredient-Import**.
2. Open the skill, click the **three dots (...)**, and choose **Try in chat**.
3. Drag and drop all of the customer's invoice and ingredient files into the chat.
4. Optional: add a short instruction, e.g. *"Please generate the import file using the ingredient data attached."*
5. Add anything learned on the intro call that changes how data is read, such as bottle size or a non-standard category framework.
6. Send it and let Claude run.

Default: If no bottle size is given, the skill assumes 1-liter bottles. The skill also applies a standard category framework unless you give it a different one.

Step B — Review the output (timebox: 10 minutes)

Claude returns two files: the ingredient import CSV and a review.csv listing every assumption it made.

1. Open **review.csv** and confirm the assumptions feel reasonable. Most common: no size on a bottle (1 L assumed), or multiple prices for one item (Claude picked the most recent one).
2. Open one of the customer's raw files and spot-check a few unit prices against the import file. Liquor should show a per-liter price.
3. If a price fails the sniff test, ask Claude in the same chat why. (In the video, one item used a more recent invoice price, which was correct.) If you disagree with Claude's assumptions, feel free to ask it to regenerate the files with a different assumption in place.
4. Save all Claude-generated files to the customer folder.

Step C — Install / open the IQ Inventory Onboarding Agent

1. In Applications, make sure you have only **one, most recent** copy of the IQ Inventory Onboarding Agent. Delete older copies.
2. If installing, open the DMG and copy the app to Applications.
3. If macOS blocks the app as untrusted, contact Anum Qassam. It may need extra steps to allow it to install.
4. Sign in. It needs **two sets of credentials**: first your Toast Web login, then your Okta / computer login.

Watch out: The second login is your Okta login (not ToastWeb!). Without both, the tool will not work.

Step D — Connect the location and upload the CSV

1. Confirm the tool is set to **PROD** (top right), then go to **Onboard** → **Ingredients**.
2. **Location:** enter the customer's GUID, connect, and refresh the data. Wait for it to finish (fewer existing items = faster).
3. **Upload:** drop in the ingredient import CSV from Step A. The tool reads the file and infers fields.
4. **Map fields:** confirm the import area is correct. **Primary unit** and **Item cost** must be mapped appropriately.

Step E — Resolve suppliers on Review & match

1. On **Review values and matches**, look at the blocking issues (shown as "Fix N blocking value issues").
2. The most common issue is **Unrecognized suppliers**. Click **Create** next to a supplier. Creating it once resolves every row that uses it.

Step F — Create categories in Toast Web

If categories show as Unrecognized, create them in Toast Web. Ideally do this before every ingredient import.

1. In Toast Web, go to **Items** → **Settings** → **Item categories**.
2. Create the suggested categories for the customer's concept (e.g. Ingredients, Prepared Food, NA Beverage, Alcohol). They can be edited later.
3. Add custom categories for anything specific to the customer, such as a retail category for cigars or a Brandy category under Alcohol.
4. Create a catch-all category called **Review Please** for items you can't place.
5. Click **Create Categories**.

Step G — Finish categories in the tool and import

1. Return to the tool and refresh so the new categories appear.
2. Assign categories to any rows that were not matched automatically.
3. For leftovers: filter to **UNASSIGNED**, select all rows, set **Category** to **Review Please**, and click **Apply to N**.
4. Once no blocking issues remain, click **Continue** to run the import.
5. When the import job completes, **download the Excel** and save it to the customer folder as the ingredient import output (e.g. in an Ingredients subfolder).

Step H — Verify

1. In Toast Web, open **Items** → **Item catalog**.
2. Set View items to **Non-sellable**.
3. Confirm the item count matches the number of rows imported (74 in the video) and that items show the expected cost and category.

4. Troubleshooting

Issue	What to do
Unit price looks wrong	Ask Claude in the same chat why it chose that price. Correct it in the CSV if needed.
Supplier doesn't exist	Click Create on Review & match. One create fixes every row for that supplier.
Categories don't exist	Create them in Toast Web (Item categories), then refresh the tool.
Items with no clear category	Bulk-assign to Review Please category and follow up with the customer.
App won't install (untrusted)	Contact Anum Qassam.
Login fails	Check you used Toast Web credentials first and Okta credentials second, with Okta Verify set up.

5. Files to keep

- Customer source files
- Ingredient import CSV and review.csv from Cowork
- Ingredient import output Excel downloaded from the tool
